Java Term Project
Crew Management System

We are Planning to create a Crew Management System used under Maritime Domain Industry.

Basically what we are planning to make is a system which can trace what specific work a crew is doing on the Ships when he/she is embarked to work.

Project is divided into few screens and some tasks.

Screen 1 : Login Screen with Login and Password Details

Screen 2: Welcome Screen Contains list of crews and their details

Screen 3 Task Screen Associated with specific crew : User can add tasks for that specific crew and set progress as well for each work for tracing.

Screen 1:

```
    Login

    Password
```

Screen 2:

Crew Name	#Tasks	Crew Details
Crew A	5	Address, Last Name , email, phone

Screen 3:

```
              Crew A

   Each Task details          Update Add Delete Tasks
```

If we achieve this early we will enhance more and add Payroll as well.
Creating a payroll sheet with basic earnings and deductions for each specific work.

Like Crew A has completed 4 tasks such as Task A, Task B, Task C, Task D then,

Task	Earnings	Deduction	Net Total
A	200	5	195
B	100	3	97
C	50	2	48
D	200	10	190
			530
